Art Unit: 2879

DETAILED ACTION

Acknowledgement of Election

1. The election to the instant application was entered on 6 February 2006.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 1-5 and 19-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Robinson (American Institute of Electrical Engineering, Volume 80, Part 1, Communication and Electronics, 1961, pages 143-150) (of record).
- 4. As to claim 1, Robinson discloses a pump device for gaseous fluid (page 143, middle column, second paragraph), comprising an ion generating region having an electron-emitting cathode electrode (page 144, Electrical Fundamentals section, second paragraph, the emitting electrodes are cathode electrodes) for generating unipolar ions in the fluid and a pumping region disposed downstream of the ion generating region (page 144, Electrical Fundaments section, the last paragraph to begin on the left hand column, "wholly of ions of one kind" are unipolar ions), said pumping region including pumping electrodes for generating an electric field in a manner that imparts motion to the ions and thus to the fluid (page 144, Electrical Fundamentals, the second paragraph; the collecting electrodes are the pumping electrodes).

Art Unit: 2879

5. As to claim 2, Robinson discloses the pump device of claim 1. Robinson further discloses wherein the electron-emitting cathode electrode emits electrons at room temperature in atmospheric air (page 143, the paragraph beginning after the Synopsis and finishing in the middle column).

- 6. As to claim 3, Robinson discloses the pump device of claim 1. Robinson further discloses an anode to which a positive voltage bias is applied to cause the cathode electrode to emit electrons into the fluid (page 144, left hand column, the second paragraph in the Electrical Fundamentals section).
- 7. As to claim 4, Robinson discloses the pump device of claim 1. Robinson further discloses that the electron-emitting cathode electrode includes a conical tip (page 146, middle column, the first paragraph under the Blower Design section, the needle electrode has a needle point tip).
- 8. As to claim 5, Robinson discloses the pump device of claim 1. Robinson further discloses that the pumping region comprises a series of pumping electrode sets whose polarity is switched in a manner to generate an electric field that imparts motion to the unipolar ions and thus the fluid in the direction (page 145, the Blowers in Series section, each electrode in the electrode set will have a switched polarity, one positive and one negative, which causes the flow of ions).
- 9. As to claim 19, Robinson discloses a gaseous fluid pump, comprising a series of pumping electrodes disposed along a fluid flow path for generating an electric field in a manner that imparts motion to unipolar ions present in the gaseous fluid and thus to the fluid in the direction of the flow path (pages 145 and 146, the Blowers in Series section).

Art Unit: 2879

10. As to claim 20, Robinson discloses the pump of claim 19. Robinson further discloses that the electric field imparts motion to unipolar ions present in air (page 143, the paragraph beginning after the Synopsis and finishing in the middle column).

11. As to claim 21, Robinson discloses a gaseous fluid pump, including a first electrode and a second electrode disposed along a fluid flow path for generating an electric field that imparts motion (page 144, Electrical Fundamentals section, second paragraph, the emitting electrodes and the collecting electrodes) to unipolar ions present in the gaseous fluid and thus to the fluid in the direction of the flow path (page 144, Electrical Fundaments section, the last paragraph to begin on the left hand column, "wholly of ions of one kind" are unipolar ions).

Claim Rejections - 35 USC § 103

- 12. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 2879

- 13. Claims 6-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson (American Institute of Electrical Engineering, Volume 80, Part 1, Communication and Electronics, 1961, pages 143-150) (of record) in view of Kalman et al. (Applied Thermal Engineering 21, 2001, 265-282) (of record).
- 14. As to claim 6, Robinson discloses the pump device of claim 1. Robinson et al. further disclose a plurality of pump devices (pages 145 and 146, the Blowers in Series section). Robinson fails to disclose a combination of a heat generating electronic component and a cooling system in thermal transfer relation with the heat-generating component to remove heat therefrom using a gaseous heat transfer fluid, said cooling system including a plurality of pump devices of claim 1 to impart motion to the heat transfer fluid relative to the heat-generating component.

Kalman et al. disclose combining a heat generating electronic component and a cooling system in thermal transfer relation with the heat-generating component to remove heat therefrom using a gaseous heat transfer fluid (pages 269-270 the Experimental section). Kalman et al. further disclose that the electrostatic blower is used to cool heat-generating bodies, such as power-unit chips (see Abstract). Kalman et al. do not specifically disclose a plurality of pump devices. However, it has been held that mere duplication of the essential working parts of a device involves only routine skill in the art. *St. Regis Paper Co. v. Bemis Co.*, 193 USPQ 8.

Therefore, it would have been obvious to one having ordinary skill in the art, at the time the invention was made, to modify the pump device of Robinson to include that the pump device is used to cool a heat generating electronic component, as disclosed by Kalman et al., for the added benefit of cooling power-unit chips.

Art Unit: 2879

15. As to claim 7, Robinson and Kalman et al. disclose the combination of claim 6. Kalman et al. further disclose that the pumping electrodes reside on one or more heat transfer surfaces (see Fig. 1; pages 269-270; the heat transfer surfaces can be any of the heating plate). Kalman et al. disclose that the electrostatic blower is used to cool heat-generating bodies, such as power-unit chips.

Therefore, it would have been obvious to one having ordinary skill in the art, at the time the invention was made, to modify the pump device of Robinson to include that the pumping electrodes reside on one or more heat transfer surfaces, as disclosed by Kalman et al., for the added benefit of cooling power-unit chips.

16. As to claim 8, Robinson and Kalman et al. disclose the combination of claim 7. Kalman et al. further disclose that the one or more heat transfer surfaces comprise one or more surfaces of the component (see Fig. 1, pages 269-270, the Experimental section) the heat transfer. Kalman et al. disclose that the electrostatic blower is used to cool heat-generating bodies, such as power-unit chips.

Therefore, it would have been obvious to one having ordinary skill in the art, at the time the invention was made, to modify the pump device of Robinson to include that the one or more heat transfer surfaces comprise one or more surfaces of the component, as disclosed by Kalman et al., for the added benefit of cooling power-unit chips.

Application/Control Number: 10/754,441

Contact Information

17. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Anthony J. Canning whose telephone number is (571)-272-2486. The examiner can normally be reached on M-F 8:00-4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nimesh D. Patel can be reached on (571)-272-2457. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
